Trades settled in the sixty minutes to now.

No trades fall in this window, so there is nothing to measure. A win rate over zero trades is not a fact about the model, and it is not printed as one.

## Per-asset breakdown

## Model quality

Whether the probabilities the bot priced on were worth believing.

| MEASURE | VALUE | WHAT IT MEANS |
|---|---|---|
| Brier score | **0.1935** | Mean squared forecast error. 0.2500 is what always saying 50% scores. |
| Mean claimed edge | **12.28%** | What the model asserted at order time, averaged over settled trades. |
| Realised return | **+0.03%** | What the book actually paid, per dollar staked. |

A large claimed edge beside a smaller realised one is the signature of a model priced against the wrong reference. That gap is what the divergence gate exists to catch, and it is the number to watch as the sample grows.
